Genomic classifiers for localized prostate cancer

Test (Company)	Sample Type	Gene Content / Platform	Intended Use	Key Evidence
Decipher (Veracyte)	RP or biopsy tissue	22 RNA expression signature	Prognostic: risk of metastasis & PCa-specific mortality; guides adjuvant vs salvage RT	Multiple RCT secondary analyses (RTOG 9601, GETUG-AFU16); high-level validation
Oncotype DX Genomic Prostate Score (Exact Sciences)	Biopsy tissue	17-gene qRT-PCR panel	Prognostic: adverse pathology at RP; long-term risk of recurrence	Validated in biopsy cohorts, integrated with NCCN risk categories
Prolaris (Myriad Genetics)	Biopsy or RP tissue	46-gene cell cycle progression (CCP) score	Prognostic: disease-specific mortality in conservatively managed pts; assists ADT decision with RT	Multiple cohort validations; less RCT integration
ProMark (Metamark Genetics)	Biopsy tissue	8 protein biomarkers (immunofluorescence)	Prognostic: adverse pathology, early recurrence	Validated in biopsy tissue; FDA-approved as risk stratifier
ArteraAI Prostate Test (ArteraAI, Veracyte partnership)	Biopsy tissue, digital H&E plus clinical features	AI/ML model (digital pathology + clinico-genomics training)	**Predictive**: identifies men who benefit from ADT with RT (short- vs long-term, or omission)	Validated on >5,000 pts from RTOG trials; first AI-based predictive test in PCa

DOI https://doi.org/10.1200/PO-25-00535

ABSTRACT

PURPOSE A biomarker to help predict outcomes after prostate cancer (PCa) focal therapy would be of considerable interest. We sought to assess the association between treatment failure after focal therapy and the Decipher score, a tumor-based genomic classifier (GC).

MATERIALS AND METHODS We performed a post hoc analysis of a single-center phase II trial (ClinicalTrials.gov identifier: NCT03503643) in which patients with unilateral grade group (GG) 2–4 PCa (n = 108) underwent hemigland cryoablation of the prostate (2017–2021; n = 108). Pretreatment biopsy tissue was subjected to transcriptomic profiling to generate GC scores. The primary outcome was the association between GC-low (<0.45) versus GC-high (≥0.45) and in-field recurrence (GG ≥2) on magnetic resonance imaging–guided biopsy 6 months post-treatment, evaluated using multivariable logistic regression.

RESULTS In the GC-high group (n = 37), treatment failure occurred in 17 patients (46%). In the GC-low group (n = 71), treatment failure occurred in 15 patients (21%). These differences were statistically significant (odds ratio [OR], 2.61 [95% CI, 1.05 to 6.51]; $P = .04$). Differences at 18 months were also significant (76% *v* 44%; OR, 3.58 [95% CI, 1.37 to 9.36], $P = .009$).

CONCLUSION In patients with PCa otherwise suitable for management with focal therapy, a high GC score (≥0.45) was independently associated with treatment failure. A GC score derived from diagnostic biopsy can be used to help predict focal therapy outcomes.

Post-hoc analysis of a phase II trial

Setting: Single center

Patients: Unilateral GG2-4 (n=108)

Treatment: Hemigland cryoablation

Primary outcome: In-field recurrence (GG≥2) at 6 months

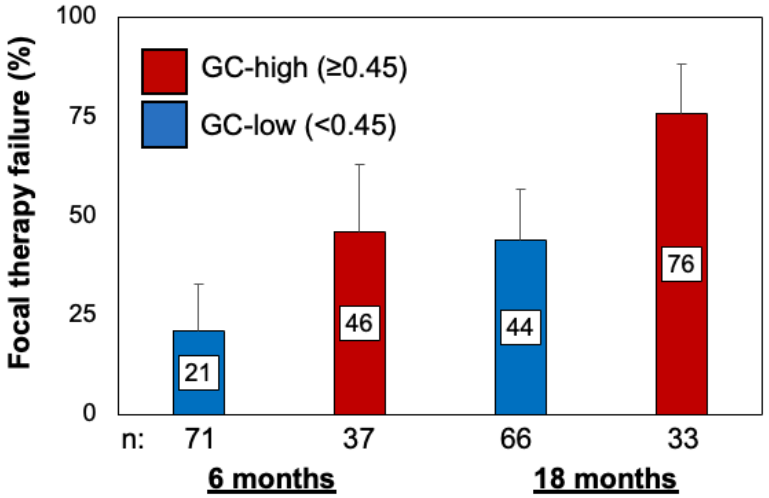
Secondary outcome: In-field or template recurrence at either 6 or 18 months

Biomarker: Commercially available, biopsy tissue-based RNA-signature
(Genomic classifier) GC-Low v GC-High

Characteristic	n (%) / Median IQR
Total	108 (100)
Age (years)	68 (63-74)
PSA (ng/mL)	6.7 (4.7-10.4)
PSA density	0.16 (0.11-0.24)
Grade group	
2	70 (65)
3-4	38 (35)
PIRADS	
1-3	19 (18)
4-5	89 (82)
Months between MRI and Cryotherapy	4.0 (2.8-7.1)
Genomic classifier	0.34 (0.20-0.50)
GC-low (<0.45)	71 (66)
GC-high (≥0.45)	37 (34)

adam.weiner@cshs.org
@adam_weiner535

Post-hoc analysis of a phase II trial



Covariate	6 months OR (95%CI)	OR	P	18 months OR (95%CI)	OR	P
GC-high vs GC-low		2.61	0.039		3.58	0.009
PSAD (per +0.1)		1.41	0.043		1.38	0.098
GG 3-4 vs GG2		1.15	0.8		0.96	0.9
PIRADS 4-5 vs 1-3		3.29	0.118		2.01	0.210

TALAPRO-2

THE LANCET

Talazoparib plus enzalutamide in men with HRR-deficient metastatic castration-resistant prostate cancer: final overall survival results from the randomised, placebo-controlled, phase 3 TALAPRO-2 trial

Karim Fizazi*, Arun A Azad, Nobuaki Matsubara, Joan Carles, André P Fay, Ugo De Giorgi, Jae Young Joung, Peter C C Fong, Eric Voog, Robert J Jones, Neal D Shore, Curtis Dunshee, Stefanie Zschäbitz, Jan Oldenburg, Dingwei Ye, Xun Lin, Matko Kalac, A Douglas Laird, Dana Kennedy, Neeraj Agarwal*

Results (median follow-up 44 mo):

OS: HR 0.62 (95% CI 0.48–0.81), p=0.0005

Median 45.1 mo vs 31.1 mo.

BRCA1/2 subgroup: HR 0.50

Median OS not reached vs 28.5 mo.

Non-BRCA HRR: HR 0.73 (p=0.066)

Trend toward benefit.

rPFS: HR 0.47; Median 30.7 vs 12.3 mo.

Talazoparib plus enzalutamide in men with metastatic castration-resistant prostate cancer: final overall survival results from the randomised, placebo-controlled, phase 3 TALAPRO-2 trial

Neeraj Agarwal*, Arun A Azad, Joan Carles, André P Fay, Nobuaki Matsubara, Cezary Szczylik, Ugo De Giorgi, Jae Young Joung, Peter C C Fong, Eric Voog, Robert J Jones, Neal D Shore, Fred Saad, Curtis Dunshee, Stefanie Zschäbitz, Jan Oldenburg, Xun Lin, Cynthia G Healy, Matko Kalac, Dana Kennedy, Karim Fizazi*

Results (median follow-up 52.5 mo):

OS: HR 0.80 (95% CI 0.66–0.96), p=0.016

Median 45.8 mo vs 37.0 mo.

By HRR status:

HRR-deficient: HR 0.55 (p=0.0035) → strong benefit.

HRR-non-deficient/unknown: HR 0.88 (NS).

rPFS: HR 0.67 (p<0.0001); Median 33.1 vs 19.5 mo.

Fizazi Lancet 2025; Agarwal Lancet 2025

adam.weiner@cshs.org
@adam_weiner535

TALAPRO-2: Key themes

BRCA mutations: Poor prognosis, strong PARPi sensitivity.
Other HRR (CDK12, PALB2): Also sensitive but data weaker.
HRR-wildtype: Uncertain benefit.

BRCA: PARPi should always be given (preferably earlier)
Earlier PARPi + ARPI: Beats sequential ARPI → PARPi
For HRR-wildtype/unknown: ARPI alone remains reasonable due to unclear benefit and toxicity risk.

Future
Combinations moving into mHSPC

PSMA and FDG

PSMA uptake on PET: Predictive of response to Lu-177-PSMA

Eligible mCRPC patients: ~83% (VISION trial)
Heterogenous response: Partial or complete response in ~51%

FDG PET: + lesions associated with worse response to Lu-177-PSMA (TheraP)
PSA response: When excluded patients with FDG+/PSMA- lesions ~66% (still investigational)

Hofman Lancet Onc 2024; Hofman Lancet 2021; Sartor NEJM 2021; Azad Lancet Oncol 2024

PSMA and FDG

Conclusion
PSMA PET+ is critical to prioritize Lu-177-PSMA
CT with contrast is still standard for detecting PSMA- lesions

Forthcoming
UpFrontPSMA (phase II) in high volume mHSPC Docetaxel±LuPSMA (n=130)
48wk undetectable PSA 16% vs 41% (no OS difference)

PSMAddition (phase III) in mHSPC (n=1126)
Intervention:
SOC (ADT + ARPI, with or without docetaxel)
vs SOC + Lu-177–PSMA-617 (given q6 weeks × 6 cycles).
Eligibility: Required PSMA PET–positive disease (no discordant FDG+ / PSMA– lesions).
Primary Endpoints: rPFS; OS

MSI-H/dMMR and TMB-high

MSI-H/dMMR: 2-3% of advanced PCa
Response to pembrolizumab can be dramatic and durable

TMB≥10 mut/Mb: <5%, nearly all were MSI-H/dMMR
Pembrolizumab approved, tissue agnostic

Clinical practice:
Always test mCRPC for MSI/MMR (tissue or ctDNA NGS panels).
Pembrolizumab is an **option in later lines** for these biomarker-defined subsets.
Outside MSI-H/TMB-high: Pembro activity in prostate cancer is minimal.

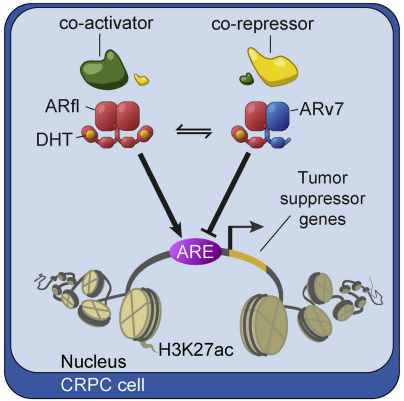
AR-V7 (Androgen Receptor Splice Variant 7)

What it is: AR splice variant lacking ligand-binding domain → constitutively active

Detection: Circulating tumor cells (CTCs), RT-PCR assays

Clinical impact:
Predicts **resistance to AR-targeted therapies (enzalutamide, abiraterone)**
AR-V7+ patients may derive more benefit from **taxane chemotherapy**

Status: Prognostic/predictive, but **not yet standard of care**
(assays not widely available/validated)



Cato Cancer Cell 2019

adam.weiner@cshs.org
@adam_weiner535

ctDNA Assays (Liquid Biopsy)

What it is: Plasma-based next-generation sequencing of tumor DNA

Clinical use:
Detects **HRR mutations, MSI-H, TMB** when tissue biopsy is inadequate
Can monitor **treatment resistance mechanisms** (e.g., BRCA reversion, AR mutations)

Advantages: Less invasive, captures tumor heterogeneity, repeatable over time

Status: Increasingly used in practice, but sensitivity varies (esp. in low tumor burden)

Advanced prostate cancer: Biomarkers

Biomarker	Frequency	Predicts	Therapy
HRR mutations (BRCA1/2, PALB2, CDK12, etc.)	~20–25%	PARP inhibitor sensitivity	**Olaparib, Rucaparib, Talazoparib, Niraparib**
MSI-H / dMMR	~2–3%	ICI response	**Pembrolizumab** (FDA tissue-agnostic)
TMB-High (≥10/Mb)	~3–5% (often overlaps MSI-H)	ICI response	**Pembrolizumab**
PSMA PET+	Majority of mCRPC	RLT eligibility	**Lu-177–PSMA-617**
FDG+/PSMA–	Subset of aggressive tumors	Poor RLT candidates	Guides away from PSMA RLT
AR-V7 splice variant	Research	ARPI resistance → chemo benefit	Not standard of care
Gene classifiers (Decipher, etc.)	Trials	Prognosis / ADT benefit prediction	Investigational in mHSPC/mCRPC
ctDNA assays	Expanding	Detect HRR/MSI when tissue limited	Increasing clinical use

adam.weiner@cshs.org
@adam_weiner535

Prostate cancer biomarkers

Localized disease: Genomic classifiers & AI tools help guide intensity of local therapy.

Advanced disease: Universal testing for **HRR, MSI, TMB, and PSMA PET** is essential; guides targeted use of **PARPi, immunotherapy, and radioligand therapy**.

Emerging tools (AR-V7, ctDNA) show promise but are not yet routine.
